

Endian Switchboard: On-Premise Edition

Endian Switchboard On-Premise is an add-on module that can be installed into any supported Endian product that provides greatly enhanced VPN functionality including easy management of users, remote network gateways, endpoint devices and even applications.

Choose Endian Switchboard On-Premise if:

- You want to be the only owner and manager of the solution
- You want to utilize the UTM features in addition to the Switchboard functionality in a single product
- You want to buy Endian hardware to run in your own environment
- You already have an Endian UTM appliance and wish to activate the Endian Switchboard module on it
- You want a lower TCO (Total Cost of Ownership) by owning the product and buying longer terms
- Have to meet industry and/or government regulations that prohibit you from using a hosted service

How to Size Your Switchboard License:

Choose the license that covers the total number of "nodes" required. Nodes shall include: (1) all endpoints defined on the Switchboard, (2) all users defined on the Switchboard and (3) third-party gateways which are non-Endian appliances connected to the Switchboard. Endian gateways do NOT count as a node. For example, if you are only using Endian gateways and wish to setup 10 total users and 40 total endpoints behind your various Endian gateways then the total number of nodes would be 50 (10 users + 40 endpoints).

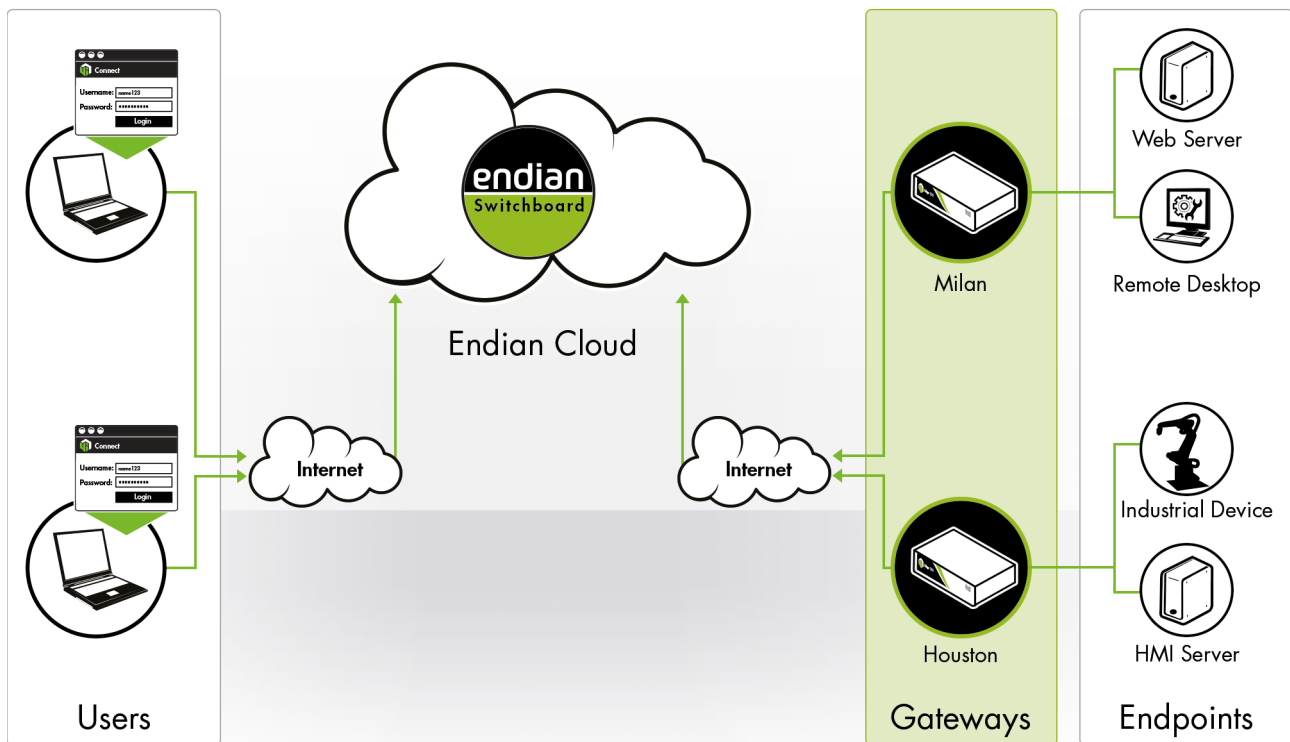

Purchasing Endian Switchboard you also receive the **Endian Connect App**, which is the dedicated client to access any Endian Switchboard functionality. The Endian Connect App comes **free of charge** with the purchase of any Endian Switchboard license.

Endian Switchboard: Cloud Edition

Endian Switchboard is a product that provides greatly enhanced VPN functionality including easy management of users, remote network gateways, endpoint devices and even applications. Endian Switchboard Cloud Edition is a solution hosted within Endian’s cloud infrastructure that makes it easy to setup and deploy the Switchboard. In addition, it provides a convenient solution for any service provider or reseller who wishes to just package and resell the licenses to the end users.

Choose Endian Switchboard Cloud Edition if:

- You want the freedom and flexibility to decide how many nodes get activated each month
- You (or your customer) do not have an IT department or do not want to manage the product in-house
- You are a service provider who wishes to re-sell Endian Switchboard services
- You are a service provider who wishes to use Endian Switchboard to distribute your own services
- You only need Switchboard VPN and do not need UTM features for your customer(s)

Sizing your Switchboard Cloud Edition:

Choose the license that covers the total number of “nodes” required at the time of purchase as you can always activate/deactivate nodes during the month, according to your needs. Nodes shall include: (1) all endpoints defined on the Switchboard, (2) all users defined on the Switchboard and (3) third-party gateways which are non-Endian appliances connected to the Switchboard. Endian gateways do NOT count as a node. For example, if you are only using Endian gateways and wish to setup 10 total users and 40 total endpoints behind your various Endian gateways then the total number of nodes would be 50 (10 users + 40 endpoints).

Purchasing Endian Switchboard you also receive **Endian Connect App**, which is the Endian dedicated client to access any Endian Switchboard functionality. Endian Connect App comes together with any Endian Switchboard license completely free of charge.
